# Data in the Upworthy Archive

## Packages

An article preview link  
tested by Upworthy

## Tests

A group of packages  
that Upworthy tested  
alongside each other

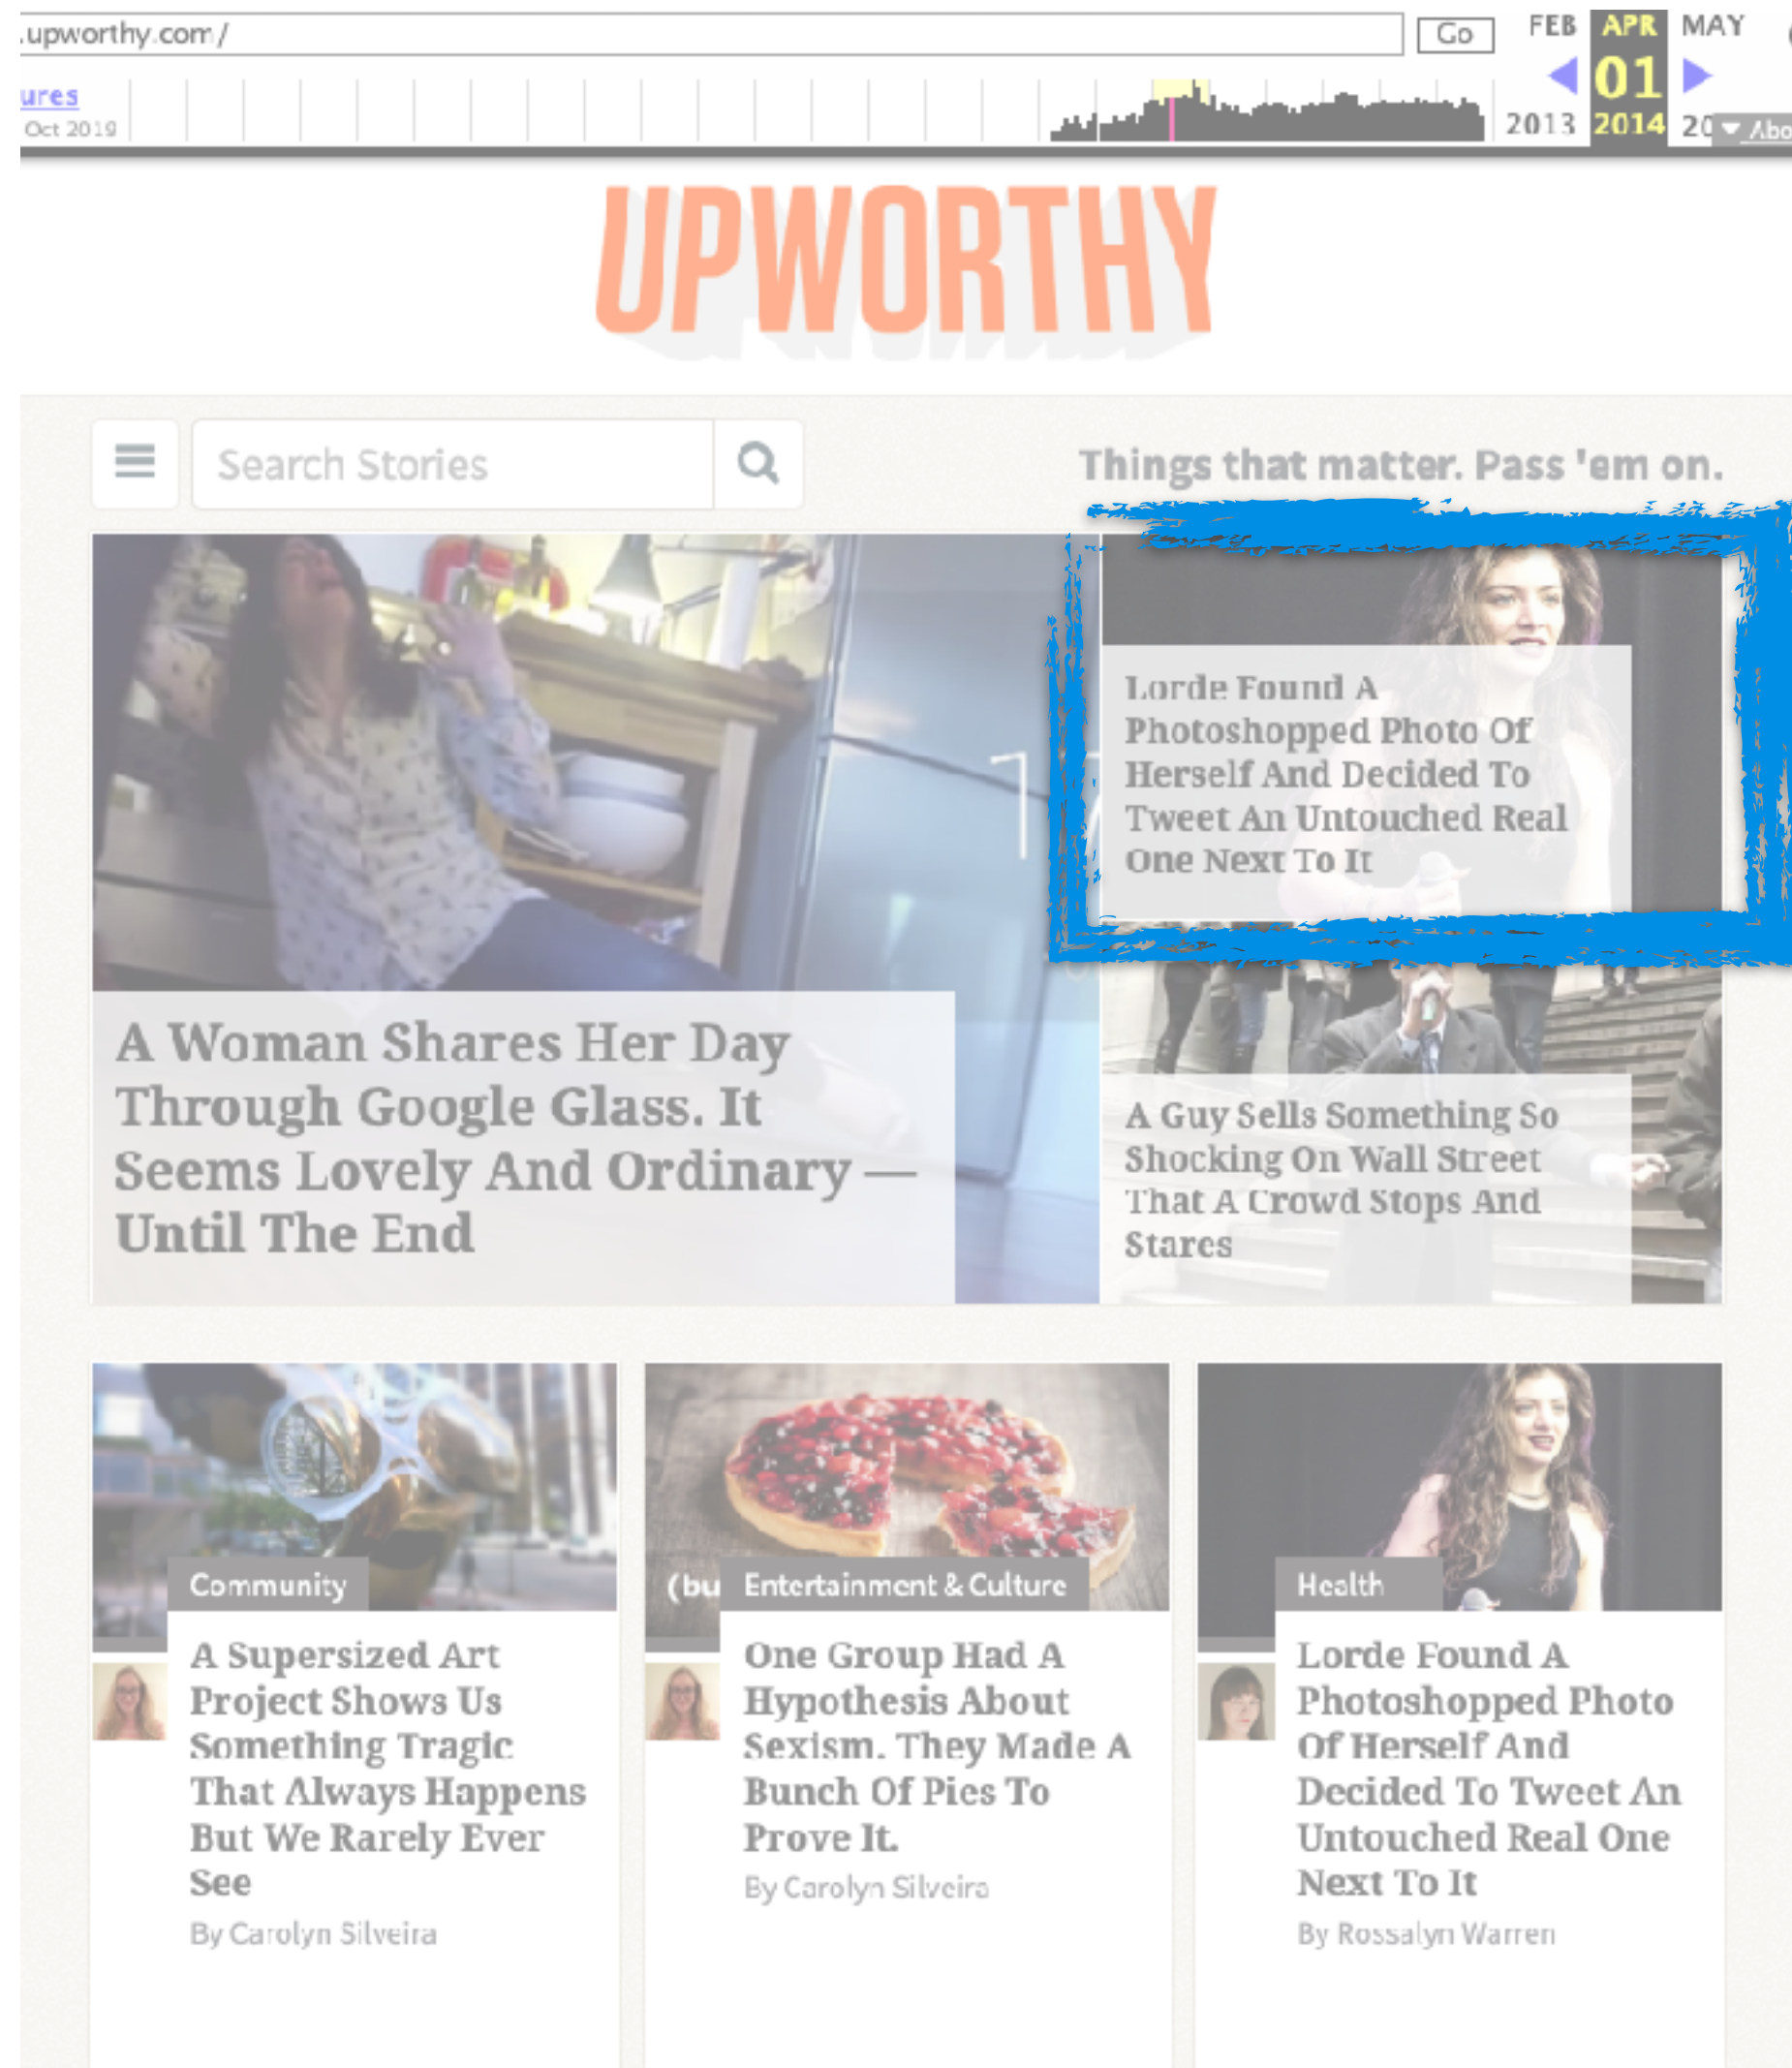

# Understanding Packages

- **created\_at**: time the package was created
- **test\_week**: week the package was created
- **clickability\_test\_id**: test the package was in
- **headline**
- **eyecatcher\_id**: image ID (we don't have images)
- **excerpt**: article excerpt (not shown in tests)
- **slug**: internal name (not shown in tests)
- **share\_text**: social media description (not shown in tests)
- **impressions**: # who viewed the package
- **clicks**: # who clicked the package

# Understanding Packages

More general terms for a thing being tested (packages was Upworthy's internal term):

- **Conditions** (refers to the experience that the participant is randomly assigned to)
- **Arms** (often synonymous with conditions, especially in studies with more than 2 arms) (**we will use this term in the class**)
- **Interventions** (often used to refer to the act of intervening)
- **Stimuli** (refers to the content of the packages / interventions)

# Tests: More than One Package

In the Upworthy Archive, tests can compare any number of packages, though most tests compare four packages

**A**

**She's Not Just Destined For Greatness, She's Destined To Do Great Things For Women**

**This Young Woman Just Took Silicon Valley By Storm And She's Not Stopping There**

**B**

**C**

**Feminism 101: This Girl Is Going Places And She's Taking Other Girls With Her**

**Remember When Math Was "Too Hard" For the Ladies? Not So Much.**

**D**

# Tests Vary More than Headlines

Since images vary and some differences between packages can be caused by image differences, not all headlines are comparable

A

She's Not Just Destined For Greatness, She's Destined To Do Great Things For Women

This Young Woman Just Took Silicon Valley By Storm And She's Not Stopping There

B

C

Feminism 101: This Girl Is Going Places And She's Taking Other Girls With Her

D

Remember When Math Was "Too Hard" For the Ladies? Not So Much.

Hypothetical: we don't have the images, just the image IDs

# Protecting Ourselves from P-Hacking

- **Confirmatory research:** In experiments, we define analysis **before** collecting data. The confirmatory process protects us from p-hacking, since we have few or no adjustments after seeing the data
- **Exploratory research:** In research with an already-collected dataset, standard practice is to keep testing ideas until we are confident about the answer, putting us at risk of p-hacking

# Cross-Validation: A Confirmatory Process for Exploratory Analysis

- **Cross-validation** involves testing a statistical model on multiple samples:
  - Researchers analyze **exploratory data** to choose a final model
  - The model is run on **confirmatory data**, and these results are accepted as final

# Upworthy Archive Cross-Validation

- **Exploratory data**: students will work with a dataset of 4,873 tests & 22,666 packages
- **Exploratory analysis**: teams will use this dataset to develop a proposed model & submit code
- **Confirmatory data**: student models will be tested on a dataset of 22,743 tests with 105,551 packages
- **Confirmatory analysis**: conducted by the professor with results shared back to student teams

# Upworthy Archive Datasets

**The exploratory dataset** is a random sample of all tests within each week in the archive. This makes it possible to test ideas about changes over time

# How to ask questions with the archive

1. Identify a **question / theory to test**
2. Develop **a method to select relevant & comparable packages & tests**
3. **Meta-analyze** the results

# What is a good question?

1. It contributes to an important **practical** or **scientific** conversation (or both)
2. The archive includes data that can answer the question
3. By the end of the semester, your team will have the skills to ask the question

# Question example: well-known people

Does including a famous person's name in a headline increase the number of clicks it receives?

# Checking if your question is askable

1. Can you detect headlines **in a way that makes sense**? (how would you identify notable people?)
2. Are there **cases in the data**?
3. Do those cases **appear in the same tests**?

# Identifying Notable People

1. Collect lists of notable people from TIME Magazine and IMDB
2. Create a method to identify headlines that **include at least one notable person's name**
3. Compare packages within tests to confirm:
  - at least one headline has a notable person's name
  - one headline doesn't have any of those names

# Valid Tests Need a Comparison

Headlines in “54eb43483138650026420000” mention two notable people, but it’s **not a valid test** because **all headlines include the same names**

- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later
- Beyoncé Had A Moment With Ed McMahon That Fueled Her Success, But It Also Hit Her Differently Later

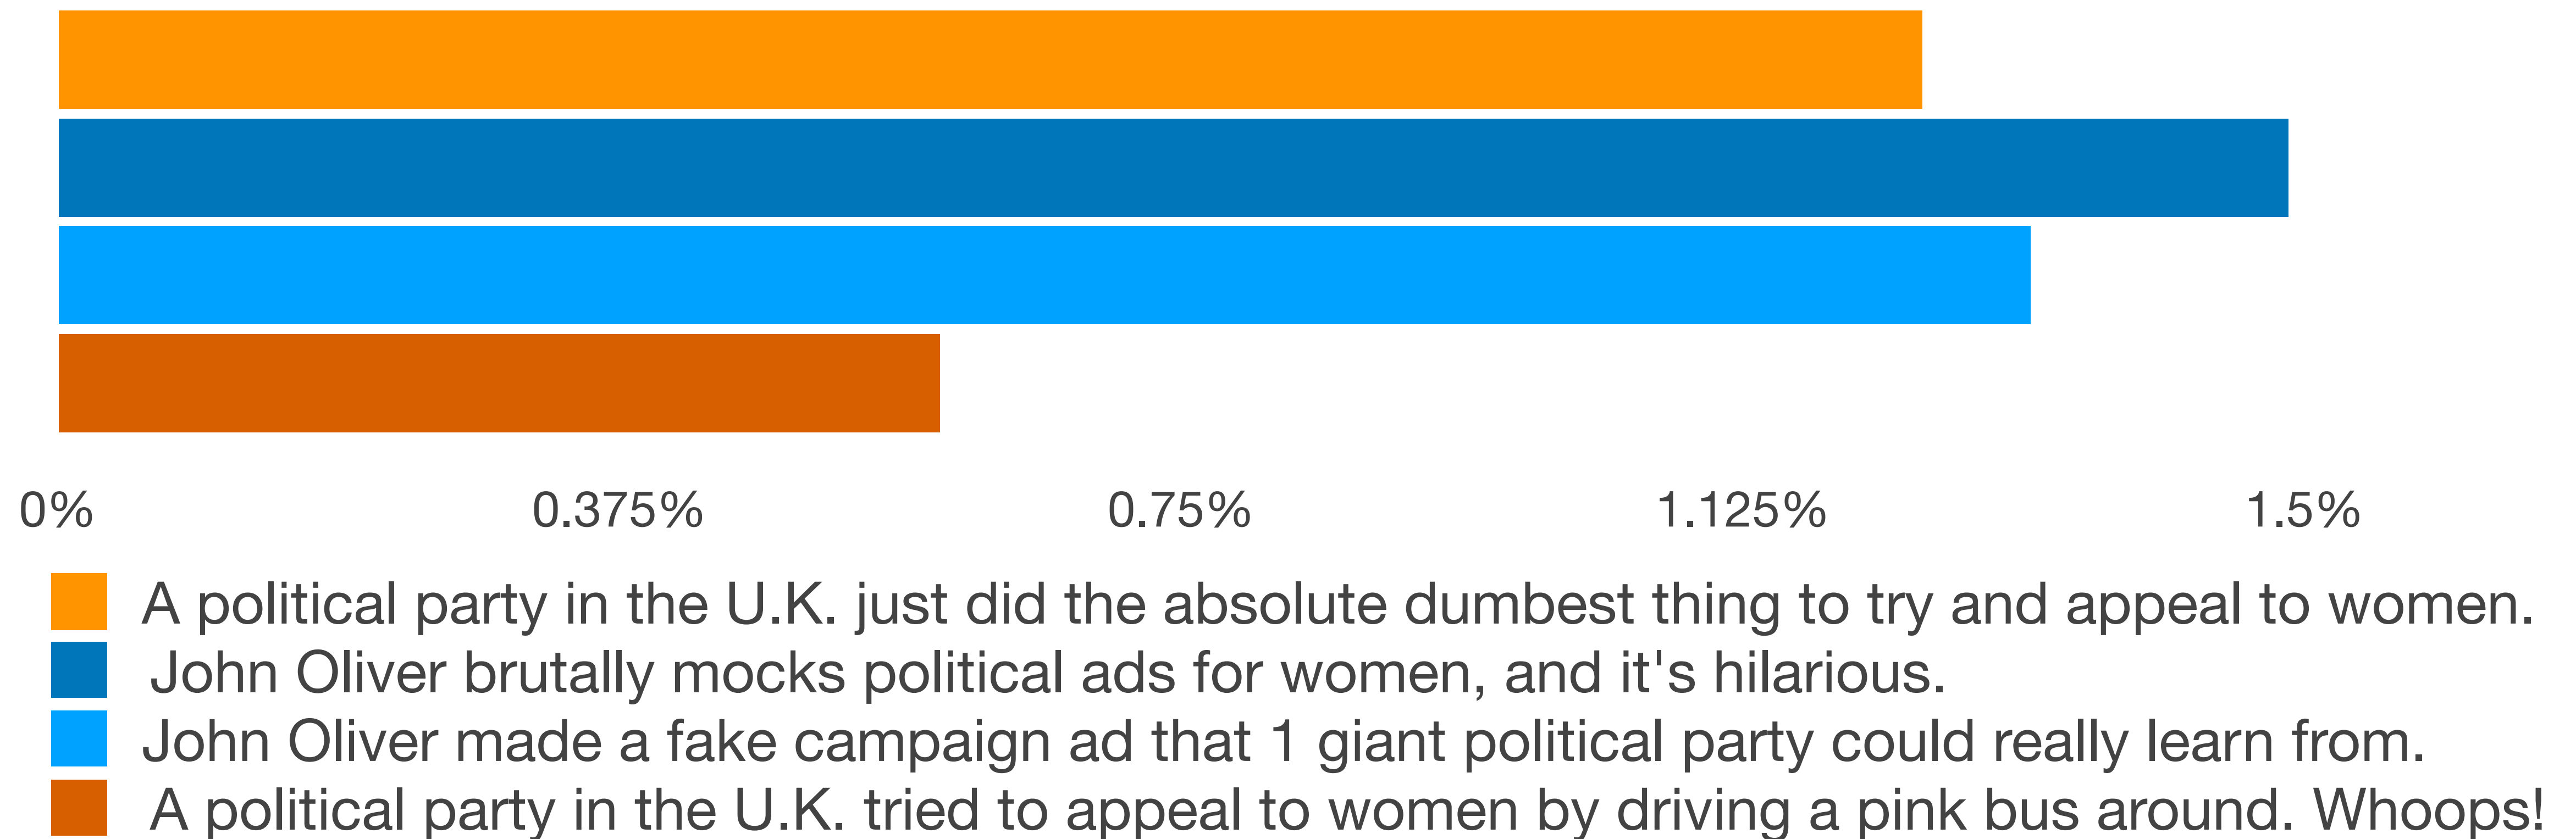

# Valid Tests Need a Comparison

Packages in “54eb43483138650026420000” have headlines that **do mention** notable people and headlines that **don't mention them**

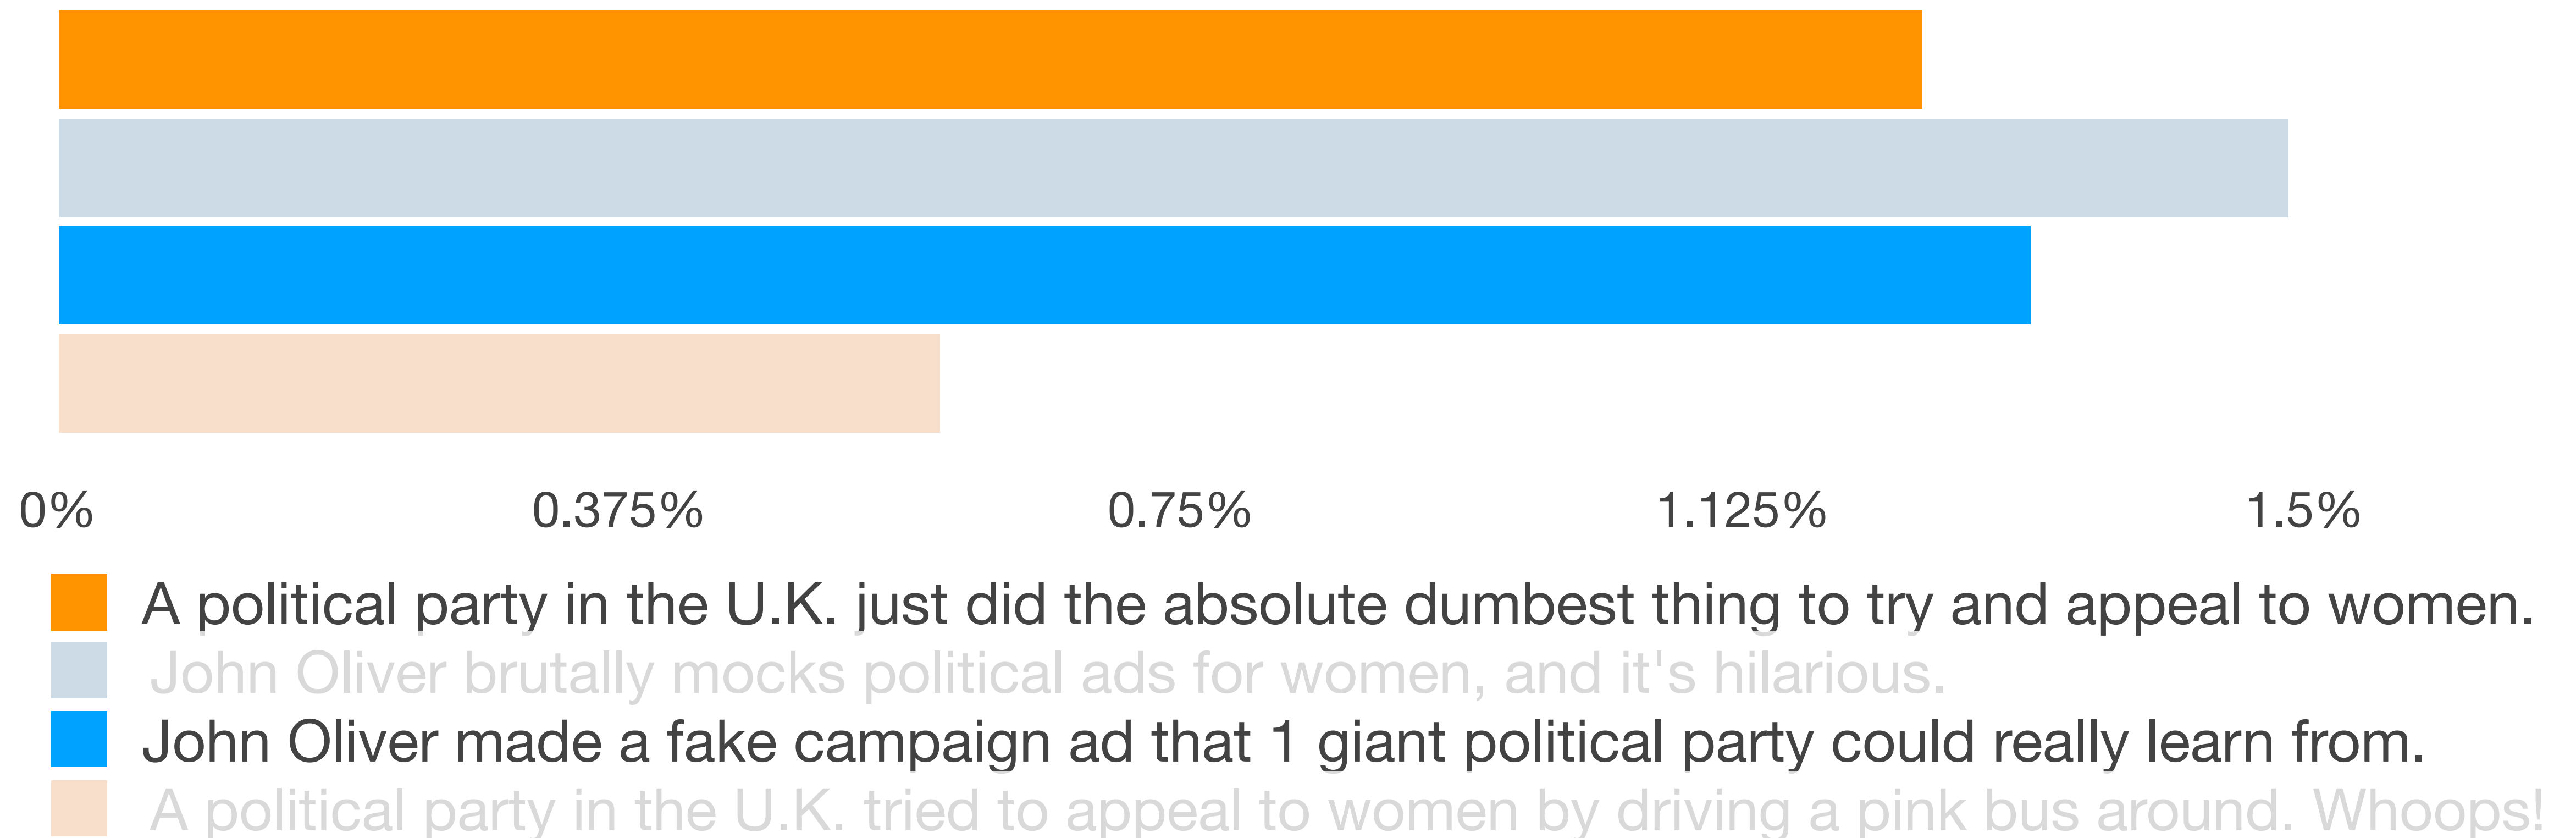

- **A political party in the U.K. just did the absolute dumbest thing to try and appeal to women.**
- **John Oliver brutally mocks political ads for women, and it's hilarious.**
- **John Oliver made a fake campaign ad that 1 giant political party could really learn from.**
- **A political party in the U.K. tried to appeal to women by driving a pink bus around. Whoops!**

# Choosing Packages to Compare

# Choosing Packages to Compare

If you choose these two, you might find **small/no** effect.

# Choosing Packages to Compare

If you choose these two, you might find a **large** effect.

# Solution: Upper & Lower Bounds

Create **two datasets**: one to identify the highest possible effect (largest difference) & another to identify the lowest possible effect (lowest difference).

The highest difference

The lowest difference

# Solution: Upper & Lower Bounds

In this test, adding a notable person's name has an effect between **.07 of a percentage point (lower)** and **0.9 of a percentage point (upper)**

The highest difference

The lowest difference

# Analyzing Multiple Tests Together

Once we have selected tests, we can analyze the combined effect across many tests. The practice of combining studies is called “meta-analysis.”

# Example Code

**Full examples for working through the unworthy archive project data are available at:**
